

PEGLER

Valve technology

VSH PowerPress®

welcome to Aalberts integrated piping systems

Aalberts Integrated Piping Systems develops and produces connectors, metal and plastic pipes, valves, and fastening technology for the distribution and control of liquids and gases. Our technologies enable customers to work quickly and reliably in a simple and efficient way. These bespoke systems are applicable for key vertical markets as residential, commercial, industrial, and Utilities, and are designed and developed by our team of in-house engineers. This complete piping and valve solution combined with our services are available through different channels.

**At Aalberts Integrated Piping Systems, we have just one objective:
we help our customers to get the job done.**

don't just buy
products,
buy solutions.

global footprint with a local presence

we operate from 30 locations in 14 countries

As the amalgamation of some of the world's most trusted manufacturers, we have a long-established, market leading presence in different key vertical markets. We operate from 30 locations in 14 countries and offer the most innovative and technically advanced product portfolios.

Our in-house engineers are constantly engaged in product development and innovations and we are the only business in the piping & valve industry **that offers its customers a complete integrated piping solution, each and every time.**

our end markets

technology leadership in selected end markets

Aalberts Integrated Piping Systems develops and produces connectors, metal and plastic pipes, valves, and fastening technology for the distribution and control of liquids and gases. Our technologies are easy to specify and maintain, and enable our customers to work quickly and reliably in a simple and efficient way. These bespoke systems are applicable for residential construction, non-residential construction, industrial use, fire protection and shipbuilding, and are designed and developed by our team of in-house engineers. This complete piping and valve solution is available through different channels.

As the first choice for customers maintaining existing piping and valve systems, or a complete installation for a new building, we can also help in the pre-build design phase. We work with experts to design the perfect tailor-made, integrated piping system for any new build projects. So whether the task is project conception, installation, or on-going maintenance, we are the **ONLY** company that truly delivers a complete product & service offering. Our know-how, our can-do, and our relentless innovation come as standard. **So don't just buy products. Buy solutions.**

our technologies

Aalberts Integrated Piping Systems consists of 4 core Technologies:

- valve technology. We offer valve solutions for industrial, residential and commercial areas and we produce from several locations in the globe. Our valves are highly trusted and respected, the comprehensive range of products offers superior quality throughout, and excellent value for money. The valves brands Apollo and Pegler are well known in their markets
- connection technology offers the broadest selection of fittings in the market, with a wide range of products. Our range is suitable for numerous applications and media for key verticals like commercial, industrial and residential. The connection brand VSH is very well known in many markets
- piping technology
- fastening technology

Pegler

Pegler provides the best solutions for integrated piping systems. This term encompasses a range of product lines for connection technology and valve technology which, together with our engineering service, offer the ultimate solution for top-quality total piping systems.

Our aim is to support you in the best way possible.

Don't just buy products, buy solutions

the strength of 'local sales organisation'

- the perfect solution for every project
- smart, fast and efficient installation
- Aalberts Integrated Piping Systems Engineering Service
- valuable advice from the drawing board to delivery
- a very wide product range, including fittings
- a 10-year system warranty
- all products are now BIM

The piping systems stand out due to their high and consistent quality, and quick and simple installation and maintenance. Pegler offers the widest, most comprehensive range of reliable press, compression, groove and push systems – including fittings for thick-walled and thin-walled metal and plastic tubes.

Aalberts Integrated Piping Systems Engineering Service

Pegler is a fully customer-focused sales and service organisation with experts who are committed to product development, service and customer support every single day. This means that from day one at the digital drawing board, you will receive professional advice on customised total solutions while being able to rely on optimum availability and reliable support both during and after delivery. Our engineers have access to all Aalberts Integrated Piping Systems products and can therefore always find the best solution which is fully customised to your needs.

Pegler is well known and respected as one of the leading manufacturers of advanced plumbing, heating and engineering products in the world. It's a reputation earned through a total dedication to quality, innovation and customer service that's been the hallmark of the company since it was established in the 1890's (originally trading as Pegler Ltd and Yorkshire Fittings Ltd).

Our success has been derived from a commitment to a philosophy based on quality, service, investment, competitiveness and innovation. Energy and water conservation is very much at the forefront of our product development.

Pegler's unique Integrated Piping System brings together valves, fittings and pipes in one complete pipe-work system, with an emphasis on delivering heat free jointing. IPS combines the best elements of modern connection and valve technology, with international quality approvals and cost effective solutions for every project.

As a business partner to some of the world's best known plumbing and heating suppliers, our unrivalled list of market leading product brands include Yorkshire integral solder ring fittings, Pegler Terrier radiator valves, VSH Tectite push-fit fittings, VSH PowerPress products, VSH Shurjoint solutions, the VSH XPress press-fit system, Pegler Valves, Prestex general brassware, Endex entfeed and Kuterlite compression fittings.

VSH PowerPress system

The VSH PowerPress product range is a press system designed for thick wall steel pipe according to DIN EN 10255, EN10220 and ASTM A53, A106, A135, A795 (schedule 10 to 40) standards. By using the VSH PowerPress system installation times are reduced significantly and a clean working environment is assured.

VSH PowerPress system products are manufactured using unique, modern machinery. Our completely automated factory guarantees you safe, high-quality products. All welded products undergo a 'leak test' in order to avoid any problems afterwards when installed.

the advantages of the VSH PowerPress system

- professional press tools
- simple, fast connection technology
- fittings from ½" to 2"
- visual press indicator
- clear identification of materials and dimensions
- Leak Before Press function
- suitable for heating and cooling installations
- full line of valves

The VSH PowerPress system offers installers a complete solution with great flexibility. The VSH PowerPress system consists of fittings and the appropriate tools and can be used on standard available steel pipes. Furthermore, the VSH PowerPress fittings can also be used in conjunction with other brands of press tools*.

performance guaranteed

We guarantee consistent quality and supply, with all fittings being manufactured in the Netherlands. In order to ensure high-value manufacturing, we employ laser-welding technology and all welded fittings (100%) undergo leak testing. The leak testing is fully automated and incorporated in the laser-welding process. All straight connectors with a threaded end are made from a single piece so that there is no risk of leakage and it is more compact for recessed pipe work, good performance is guaranteed. The quality of our fittings is also proven by the large number of national and international tests. A wide range of system and product tests are available.

reliable

With VSH PowerPress systems, the quality of the connection is mainly determined by the tool and not the installer, thereby considerably reducing the risk of errors during installation. All fittings are fitted with a 'Leak Before Press' (LBP) function, which reduces the risk even further. This LBP function ensures that fittings, which have not been pressed, will leak during the initial pressure test. The installer can immediately see which fittings he forgot to press. Once pressed, the system is guaranteed airtight and watertight.

*See page 48

Next to the LBP function, all fittings are also equipped with a Visu-Control® feature. After finishing the pressing procedure the Visu-Control® ring will snap from the fitting, immediately showing which fitting has been pressed. This eliminates the need for marking already pressed fittings afterwards, adding additional safety and saving time.

easy and clean

Compared to other 'cold' connection methods, VSH PowerPress is an extremely user-friendly solution:

- the use of VSH PowerPress dispenses with the need for complicated clamping techniques, time-consuming preparations and drying time - installation is faster and cleaner;
- no need to thread the pipes;
- no lubrication needed for installation;
- easy insertion of the pipe in the fitting due to the special design of the fittings;
- short radius bends ensure compact and space-saving installation.

The above features ensure that no special skills are required for an installation and that the work can be carried out in a pleasant and safe environment.

safe

The installation of the VSH PowerPress system does not require any heat source (as, for example welding or soldering) or other heavy and potentially dangerous tools. This feature makes VSH PowerPress the ideal solution for repairs or renovation projects, since you can ensure a minimum of disturbances at the site.

fast

This simple, fast connection technology and the short preparation times for the pipe result in further considerable cost savings in the installation. As the connection is only achieved using press tools, no other materials, such as gases, adhesives, threading machines, etc., need to be purchased or hired.

PPSU550 Ball Valve PN16

specification

- lockable latching handle
- identifiable lock indication
- reversible handle insert
- suitable for non potable water applications
- socket transport protection
- visual press and union indicators
- corrosion resistant
- chrome plated brass (CW617N) full bore ball
- PTFE ball seats
- DZR brass (CW511L) body

PP900 Static Balancing Valve PN16

specification

- venturi nozzle
- regulation, isolation and flow measurement
- setting scale precise and easy to read
- no change in setting when isolating
- easy identification of open or isolated position
- suitable for non potable water applications
- socket transport protection
- visual press indicators
- corrosion resistant

See page 64 for further details.

PPSU900 Static Balancing Valve PN16

specification

- venturi nozzle
- regulation, isolation and flow measurement
- setting scale precise and easy to read
- no change in setting when isolating
- easy identification of open or isolated position
- suitable for non potable water applications
- socket transport protection
- visual press and union indicators
- corrosion resistant

PP902 Dynamic Balancing Valve PN16

specification

- automatic balancing
- direct flow measuring of actual flow
- high flow accuracy
- easy system flushing due to removable cartridge
- suitable for non potable water applications
- socket transport protection
- visual press indicators
- corrosion resistant

8	Union end adaptor	Carbon steel zinc nickel plated

See page 68 for further details.

PP913 Strainer Valve PN16

specification

- high effective protection from system debris
- gunmetal body
- Y pattern
- stainless steel mesh
- suitable for non potable water applications
- socket transport protection
- visual press indicators
- corrosion resistant

VSH PowerPress®
technical
support
information

technical data

areas for using the VSH PowerPress system

central heating installation

VSH PowerPress fittings with steel pipes that fulfil EN 10220-1, EN10255, ASTM A53, A106, A135 or A795 (schedule 10 to 40) in closed loop systems.

O-rings:	EPDM (black)
Operating temperature:	-40°C to +135°C
Operating pressure:	Max. 16 bar

cooling water installations

VSH PowerPress fittings with steel pipes that fulfil EN 10220-1, EN10255, ASTM A53, A106, A135 or A795 (schedule 10 to 40) in closed loop systems.

O-rings:	EPDM (black)
Operating temperature:	-40°C to +135°C
Operating pressure:	Max. 16 bar

compressed air installations

VSH PowerPress fittings with steel pipes that fulfil EN 10220-1, EN10255, ASTM A53, A106, A135 or A795 (schedule 10 to 40) can be used for compressed air under the following conditions:

Water content: 8573 part 1	max. 880 mg/m ³ , class 3, ISO
Oil content: 8573 part 1	max. 25 mg/m ³ , class 5, ISO

Class	Water content (mg/m ³)	Oil content (mg/m ³)	O-ring
1	3	0.01	EPDM
2	120	0.1	EPDM
3	880	1	EPDM
4	6.000	5	EPDM
5	7.800	25	EPDM
6	9.400	>25	HBNR

Compressed air and iso classification - o-ring to be used.

The EPDM O-rings may only be used for synthetic oil or dry compressed air (not exceeding 25 mg/m³).

O-rings:	EPDM (black)
Operating temperature:	-40°C to +135°C
Operating pressure:	16 bar
Ball valves operating pressure	10 bar

Compressed air pipeline systems must be properly tested as soon as the installation work is finished. The system designer and installation contractor must ensure safe methods are selected for testing the system. The methods must comply with all current health and safety regulations.

They may include testing compressed air lines with fluids or compressed air at a specific pressure, or a combination of both. We recommend that the maximum working pressure of the product not be exceeded under any circumstances during this process. Since 30 May 2002, most pressure equipment and installations on the market have had to comply with the Pressure Equipment Directive (PED) 1999. The Directive concerns items such as vessels, pressurised storage containers, heat exchangers, steam generators, boilers, industrial piping, safety equipment and pressure accessories. Please note that Article 3(3) of the PED applies to VSH PowerPress. This means that only sound design and safe instructions for use and maintenance are required.

VSH PowerPress pipes

steel pipes for VSH PowerPress

VSH PowerPress fittings in the dimensions ½" up to 2" are compatible with EN10220 series 1, EN10255 (formerly BS1387) and ASTM A53, A106, A135 and A795 black steel pipe. These pipes can be supplied as black steel, industrially painted, Galvanised or epoxy coated. Special care should be taken when installing coated pipes. This section gives you all technical parameters that are especially relevant when working with VSH PowerPress and steel pipes.

insulation

The following must be observed when insulating steel piping systems:

- cold water lines should be protected against condensation and overheating in accordance with DIN 1988, Part 200.
- hot water lines must be insulated to prevent heat loss in accordance with the Energy-Conservation Act (EnEG).

pipe surfaces

Pipe surfaces for each type of pipe must be smooth, free of indentations, pits and deformations and must be clean and free of debris, rust, scale, oil and grease.

It is not necessary to completely remove protective coatings or to expose the bare steel material. To avoid leak paths, engraved or stamped pipe shall not be used with the VSH PowerPress fitting system (removing the engraving or stamping through use of a grinder or other tool does not change this).

painted black (and lacquered) iron pipe

The pipes should be inspected for excessive paint runs. If excessive paint runs are existing, the surface of the pipe shall be smoothed by means of fine grit sand paper.

epoxy coated iron pipe

Epoxy coatings on black steel pipe have the tendency to increase the outer dimension of the pipe. The thickness of the coating should be reduced to allow the installation of the VSH PowerPress fitting. The maximum allowed thickness of the epoxy coating is 300 µm. The surface of the pipe shall be smoothed by means of fine grit sand paper.

pipes according EN 10220

VSH PowerPress can be used in combination with EN 10220 pipe series 1. Series 2 and 3 are not released in combination with PowerPress.

Size	DN	Outside diameter (mm)		Wall thickness (mm)	
		min.	max.		
½"	15	21.3	21.0	21.8	0.5 - 5.4

2"	50	60.3	59.7	60.8	1.0 - 16.0

Pipes according EN 10220 (series 1).

pipes according EN 10255 (formerly BS1387)

VSH PowerPress can be used in combination with EN 10255 pipe. EN 10255 differentiates between heavy pipe series H and medium type L, L1 and L2. Within these series both longitudinal welded as seamless pipe types exist.

Size	DN	Outside diameter (mm)		Wall thickness serie H - heavy (mm)	Wall thickness serie M - middle (mm)	
		min.	max.			
½"	15	21.3	21.0	21.8	3.2	2.6
¾"	20	26.9	26.5	27.3	3.2	2.6

1 ½"	40	48.3	47.9	48.8	4.0	3.2
2"	50	60.3	59.7	60.8	4.5	3.6

Pipes according EN 10255 (series h and m).

Black steel

Galvanised steel

Epoxy coated

VSH PowerPress fittings

technical characteristics

VSH PowerPress FITTINGS are produced from St 35 steel and protected against corrosion by a zinc-nickel coating of 3-5 µm. The zinc-nickel coating provides protection to the exposure of condensation which can occur on cooling installations. The VSH PowerPress fittings are fitted with an EPDM O-ring.

threaded fittings

The VSH PowerPress product range also include components with inner and outer threads. VSH PowerPress fittings with inner and outer threads are manufactured in accordance with ISO 7/1 or ISO 228. With threaded couplings, we recommend that the sealing be executed before the pressing, in order not to stress the press connection.

VSH PowerPress fittings markings

VSH PowerPress fittings		
	Marking	Packaging label
	Red Visu-Control® ring VSH PowerPress Dimension Traceability code Country of origin	Type Dimension Description EAN no. Art. no. Quantity

O-rings

The standard fittings are fitted with an EPDM profiled O-ring. The O-ring has been designed in such a way, that a leak tight connection is always guaranteed, even with uneven surfaces.

EPDM - black		
	Temperature	Applications
	-40°C to +135°C Peak 150°C	For all installations for hot and cold water, circulation pipes, compressed air, etc.

VSH PowerPress 'Leak Before Press' function

VSH PowerPress are delivered with a 'Leak Before Press function' (LBP). Fittings with a Leak Before Press function have the advantage that connections that have not been pressed will leak water during pressure testing. This means that an incomplete press connection can easily be identified. If correctly assembled, the press fittings will be water and air tight after being pressed.

alternative VSH PowerPress applications

The choice of fittings and pipes depends on what the purpose of the system is, the medium and the operating conditions. Please contact us regarding approval for the use of VSH PowerPress fittings for applications other than for heating, cooling and compressed air. Installations must always comply with local regulations.

electrical heat tracing

VSH PowerPress may be used with electrical heat tracing in order to maintain the temperature of the piping. Sealed pipes must not be heated because of the danger posed by the excessive and inadmissible increase in pressure in the pipes.

(main) equipotential bonding

All metal piping systems using equipotential bonding must comply with equipotential bonding requirements. Continuity checks must be conducted by a qualified electrician in accordance with the regulations, once the installation work has been finished. VSH PowerPress in combination with the respective pipes are electrical conductive pipe systems due to the metal-to-metal contact between fitting and pipe and, therefore, must be included in the equipotential bonding.

Size	DN	Outside diameter (mm)		Wall thickness (mm)	
		min.	max.

Pipes dimensions according ASTM.

press tools

Press tools consist of a press machine and the corresponding press jaw or sling. The press machine can be either battery or electrically powered. The corresponding press slings must be used for each diameter of pipe in the system in order to achieve a perfect connection. The figure below shows a cross-section of the PowerPress profile before and after pressing.

All VSH PowerPress fittings with a diameter from ½" to 2" can be pressed using the appropriate press tools listed in our product range. You must use the DW-profile that correspond to the diameter to be installed of the VSH PowerPress system (VSH XPress and VSH SudoPress jaws and slings can not be used for VSH PowerPress). A special adaptor may also be required in addition to the press slings.

We guarantee an excellent press connection, provided the tools are used correctly.

Before pressing

After pressing

maintenance and correct usage of press tools

Correct pressing with the VSH PowerPress systems is guaranteed when the press tools listed in the tables 2.4.1 are used correctly. Regular maintenance and lubrication of the press jaws, slings and tools is necessary. Please observe the manufacturer's instructions for use and maintenance. Badly maintained and/or damaged press jaws pose a potential risk.

Press tools approved for VSH PowerPress.

installation guidelines

When installing VSH PowerPress always make sure to take proper care in using protective gear on the building site. Safety shoes, hat and glasses should be the minimum of protection when installing VSH PowerPress.

1. transport and storage

When transporting and storing VSH PowerPress fittings or valves, damage and contamination must be avoided. The optimal storage temperature for the fittings is between 10°C and 25°C. The products must be stored in a dry place (max. humidity 65%) in their original packaging. It is advised to not remove the product from the bag before installing.

2. cut the pipe to length

After measuring, the pipes can be cut to length using a pipe cutter, a fine-toothed handsaw or an electrical mechanical saw suitable for the pipe material. The pipe must always be cut completely through. Never partially cut the pipe and break it off as this could cause leakage. When cutting already

installed pipes, always take into account a minimum distance to weldings and bends of $3 \times d$ (but minimal 100 mm).

Do not use oil-cooled saws, grinding wheels or flame cutters.

3. deburring the pipe

Pipe ends must be carefully and thoroughly deburred in- and outside after being cut to length in order to avoid damage to the O-ring when inserting the pipe into the press fitting. A file or hand deburrer or an electrical pipe deburrer suitable for the material may be used to deburr both inside

and outside of the pipe. Burrs sticking to the pipe must be removed.

4. cleaning the outside of the pipe

Always ensure that any dirt, scale, excessive paint or corrosion particles are removed from the surface of the pipe. This can be done with a wire brush or fine grit sand paper.

The pipe surface of the pipe must be smooth, free of indentations, pits and deformations and must be free of oil and grease.

5. marking insertion depth

The required insertion depth must be marked on the pipe or the press fitting (the latter for fittings with pipe ends) in order to guarantee a safe and proper joint. The pressing operation behind the bead is of crucial importance for the tensile strength.

The marking on the pipe must remain visible (but close to the fitting) after the connection is pressed to identify any movement before or after pressing.

6. check the fitting and pipe

Before assembly, the protective cap has to be taken from the fitting after which the fitting must be checked to ensure that the O-rings are present and correctly positioned. Pipe, fitting and O-ring must be examined for any foreign materials (e.g. dirt, burrs), which must be removed, if present. Please

make sure that the Visu-Control® ring is properly aligned before pressing.

7. assembly of fitting and pipe

Insert the pipe carefully into the press fitting up to the marked insertion depth, without tilting, pushing it in the direction of the axis. The insertion depth marking must remain visible. In the case of fittings without a stop the fittings should be inserted at least as far as the marked insertion depth. Rough and

careless insertion of the pipe into the press fitting may result in damage to the O-ring and is therefore not permitted.

If assembly is difficult because of the permitted tolerances in size, a lubricant, such as water or soap, may be used. Under no circumstances may oils, fats or grease be used as lubricants.

To optimise the installation time, time may be saved by first assembling a number of connections and then pressing the various pipe connections one after the other.

Marking the distance (d_{min}) provides a check that the pipe has not been pushed out of the fitting during the pressing process. Before starting the final pressing process of the various pipe connections, it is also important to check the minimum required distances for the installation (see table).

Outside \varnothing	Insertion depth e_s (mm)	Minimum distance d_{min} (mm)	Minimum pipe length $2 \times e_s + d_{min}$ (mm)
½"	28	5/15	61/71
¾"	31	5/15	67/77
1"	36	5	77
1 ¼"	48	10/15*	106/111*
1 ½"	49	10/15*	108/113*
2"	53	10/15*	116/121*

Minimum distances between pressings (*for slings).

The table below gives the minimum required working space so that the pressing of the fittings can be carried out correctly using the appropriate press tools. These distances relate to the general installation configurations that are schematically depicted in figures 1, 2 en 3.

Outside \varnothing	Fig. 1		Fig. 2			Fig. 3
	a	b	d	b	c	e
½"	70/75	30/60	80/75	35/60	50/80	50/20
¾"	80/85	35/65	90/85	40/65	55/80	50/20
1"	95	45	105	50	65	50
1 ¼"	125*	95*	125*	95*	80*	20*
1 ½"	135*	105*	135*	105*	80*	20*
2"	140*	105*	140*	105*	80*	20*

Space needed for installation (*for slings).

pressing

Before starting to press, the press jaws and slings must be checked for dirt, which must be removed if present. Furthermore, the press machine must be in good condition and the instructions for operating the device, maintenance and the manufacturer's instructions must be observed.

In order to create a correctly pressed connection, the groove of the press tool must enclose the press fitting O-ring bead. Once the pressing has started, always complete the press cycle and under no circumstances interrupt the process. The approved machine, press jaws and press slings are shown on our online tool selector: www.vsh.eu/presstool.

it is not permitted to press a connection more than once

The pressing process can cause deflection (angular displacement). This behaviour can be corrected by alternating the position of the press tool/jaw on each connection. As an example you could choose to place the machine first left, then for the next connection the machine would be placed on the right side. The deflection of the joint is not something which can be prevented, but it can be minimized using the above method.

corrosion protection

In the case that VSH PowerPress fittings are used in an application where a full corrosion protection is needed (such as cooling installations), always take care to protect the cleared pipe surface which was made for the installation procedure.

general installation information

thermal expansion (in the piping system)

The level of thermal expansion within piping systems depends on the type of materials used. This linear expansion needs to be taken into account during the installation. Small changes in length can be accommodated by having adequate space for expansion as well as by the elastic properties of the piping system itself. More substantial changes in length need to be offset by other means; e.g. installation of special expansion compensation devices, fixed anchoring points and brackets.

Expansion can be offset by the use of a pipe segment, U-bend or compensators. The level of expansion to be offset can be determined beforehand by calculating the changes in length.

The equation for calculating the changes in length is as follows:

$$\Delta l = l \times \alpha \times \Delta T$$

- Δl = total linear expansion [mm]
- l = length of the segment in question [m]
- ΔT = temperature difference [K]
- α = linear expansion coefficient

pressure drop

Every fluid that flows through a piping system experiences continuous and local flow resistances, the so-called pressure drops. There is a difference between the continuous and the local pressure drop. A continuous pressure drop is mainly caused by the flow resistance in straight pipe sections, which essentially is a result of the friction between the fluid and the pipe wall. Local pressure drops, on the contrary, are those flow resistances that are created by, for instance, a change in the internal pipe diameter, a pipe branch, an elbow, etc.

continuous pressure drop

To calculate the resistance of a fluid flow in a straight section of a piping system, first determine the resistance in a unit of length and then multiply the total length by this value. This value can be determined analytically using the Hazen-Williams formula.

$$p = \frac{6,05 \times 10^5}{C^{1,85} \times d_i^{4,87}} \times Q^{1,85}$$

- p = pressure drop in the pipe [bar/m]
- Q = flow through the pipe [l/min]
- d_i = mean internal diameter of the pipe [mm]
- C = constant for type and condition of the pipe

If you wish to perform these calculations, please consult the relevant specialised literature.

local pressure drops

A local pressure drop is, as mentioned at the start of this section, the resistance to flow that results from changes in the flow direction and cross-sectional area, flow splitting

over several channels, etc. There are, in general, two ways of calculating such flow resistances: the direct analytical method and the method that uses 'equivalent lengths'.

equivalent length method

This method assumes that the pressure drop at a particular point can be considered to be the same as an equivalent increase in the length of a straight piping system with the same internal diameter. The final result is a pressure drop that is equal to the real pressure drop. In other words, the actual length of the piping system is added to all the equivalent lengths of the individual joints (see below).

The actual length is then multiplied by the pressure drop per unit-length in order to be able to calculate the total pressure drop of the system. This method is not as accurate as the direct method but has the advantage that the calculation can be carried out faster.

ζ direct analytical method / equivalent length method (m)

OD	DN	ζ	(m)	ζ	(m)	ζ	(m)	ζ	(m)	ζ	(m)	ζ	(m)
¾"	20	0.61	0.37	0.51	0.32	0.38	0.24	0.96	0.59	0.32	0.20		
1"	25	0.64	0.53	0.54	0.46	0.42	0.35	1.06	0.89	0.29	0.24	0.32	0.20
1¼"	32	0.51	0.62	0.38	0.47	0.32	0.39	0.93	1.13	0.26	0.31	0.35	0.29
1½"	40	0.45	0.65	0.32	0.47	0.29	0.42	0.83	1.22	0.22	0.33	0.26	0.31
2"	50	0.48	0.94	0.35	0.69	0.29	0.57	0.93	1.82	0.22	0.44	0.26	0.38

Table with equivalent lengths and zeta values of local pressure drops.

direct analytical method

The local pressure drop can be calculated using the following equation:

$$\Delta p_L = \sum \zeta \times v^2 \times \gamma / 2 \times 10^{-5} \text{ [bar]}$$

- v = flow velocity of the fluid [m/s]
- γ = specific density of the fluid [kg/m³]
- ζ = local flow resistance coefficient

The table on the previous page gives the zeta [ζ] values for each type of fitting. We can assume that zeta [ζ] is velocity-independent for those velocities that occur in domestic installations or in other normal applications; this is supported by the fact that the change in zeta [ζ] as a function of the Reynolds number in these velocity ranges is only minimal. Once the zeta [ζ] value is known, you can read the corresponding local pressure drop off directly.

heat losses

Just as with all other types of pipes made from metal or synthetic materials, adequate measures must be taken to limit heat losses. Please consult the relevant regulations on minimum insulation thicknesses and the insulation standards.

built-in

welding requirement

The following requirements have to be considered when welding in the same vicinity as VSH PowerPress fittings.

welding adjacent to already installed VSH PowerPress fittings

When welding adjacent to an installed VSH PowerPress connection, the installer must remain at least 100 mm away from the connection to prevent damage to the O-ring. The installer should take the following precautions to keep the VSH PowerPress connection cool while welding:

- wrap the connection with a cold wet rag
- protect the connection with a weld blanket
- fabricate weld connections prior to installing the pressed fitting (make sure the pipe has cooled before installing the fitting)
- consistently apply 'spray type' spot freezing

welding inline with installed VSH PowerPress fittings

When welding inline to an installed VSH PowerPress fitting, the installer must remain at least 90cm away from the connection to prevent damage to the O-ring. The installer should take the following precautions to keep the VSH PowerPress connection cool while welding:

- wrap the connection with a cold wet rag
- protect the connection with a weld blanket
- fabricate weld connections prior to installing the pressed fitting (make sure the pipe has cooled before installing the fitting)
- consistently apply 'spray type' spot freezing

guidelines for distances of mounting brackets

Always make sure to have hangers and supports conform to the local requirements. All parts of the hangers and supports must be designed and installed in such a manner that they support the piping. Always make sure to place sliding hangers in such a way that they don't become rigid hangers by accident.

Ø Pipe diameter [mm]	Max. distance [m]
½"	2.75
¾"	3.00
1"	3.50
1 ¼"	3.75
1 ½"	4.25
2"	4.75

Distances between mounting brackets in accordance with EN 806, part 4.

Observance of the above distances between attachment points is not sufficient in itself. Heat expansion also needs to be appropriately compensated for in horizontal stretches and, therefore, the distances above may need to be adjusted.

mounting pipes

When securing the pipes, the following must be borne in mind: The load-bearing capacity of the mounting brackets must correspond to the weight of the pipelines and also withstand expansion and torsion forces. Mounting brackets, such as fixed mounting points and clips, must therefore be correctly placed and assembled.

Attachment points may only be fitted onto straight pipe sections. Mounting directly onto fittings is not allowed.

pressure test

As soon as a piping system has installed, it must be checked for leaks before being covered up and concealed. With heating and cooling installations, the pressure test can be carried out with water, air or inert gases. The test medium and the results of the pressure test must be documented in a so-called pressure test report.

IMPORTANT:

VSH PowerPress stresses that a pressure test of the piping system must be carried out in all cases. Before being covered up, insulated, painted or walled in, a piping system must first undergo a pressure test in order to be certain that there are no leaks. Pressure tests must always be performed in accordance with local regulations. As a rule of thumb, a pressure of 1.5 times the operating pressure is used for pressure tests with water.

IMPORTANT:

When testing an VSH PowerPress installation, make sure that no water remains in the system afterwards, in order to avoid the risk of corrosion, unless the system is going to be put into service shortly afterwards.

pressure test for heating systems and cooling systems

IMPORTANT:

As a rule, the pressure test for piping that has already been laid is carried out with water in accordance with DIN-VOB 18380.

- The test pressure at each point of the system must be 1.3 times the operating pressure and at least 1 bar overpressure.
- Immediately after the cold water pressure test, the water must be heated up to the highest hot water temperature on which the calculations were based in order to be certain that the system remains tight at high temperatures.
- During the test there must be no drop in pressure.
- The pressure test must be adequately documented.

pressure test with air

IMPORTANT:

The pressure test with air or inert gases can be carried out in accordance with the ZVSHK/BHKS technical bulletins, "Pressure Test with Air or Inert Gases", (at 100 l pipe capacity a leak tightness test at 110 mbar for at least 30 minutes. For every additional 100 l, the time must be increased by 10 minutes. After the leak tightness test, the strength of the connection is to be tested during 10 minutes at: a maximum of 3 bars up to DN50, maximum of 1 bar >DN50). For safety reasons, the maximum test pressure is set at 3 bars.

flushing the network

Each piping system must be flushed thoroughly before being put into use so that any foreign matter is removed from the inside of the pipe surface and so that hygiene problems and corrosion damage are largely prevented. In exceptional cases, it may be necessary to flush the system with a disinfecting substance. When flushing with a disinfectant substance, special care must be taken to ensure that no chlorides remain on the inside of the pipes. Always make sure to flush with clean potable water.

corrosion

There are different kinds of corrosion: chemical corrosion, electro-chemical corrosion, internal and external local corrosion, stray current corrosion, etc. All these kinds of corrosion have very particular chemical or mechanical causes. The following paragraphs provide some simple hints on how to avoid such problems.

electro-chemical corrosion

Electro-chemical corrosion occurs under the following circumstances:

- an electrochemical potential difference between both parts
- the presence of a conductive fluid (electrolyte), such as water
- the presence of oxygen (O₂)

A distinction must be made between heating installations and water supply installations. There are no significant amounts of oxygen in heating installations, when they are properly installed and operated and there will thus be very little corrosion. In water installations, however, the oxygen content is very high, nearly at the saturation point. It is of primary importance that the VSH PowerPress System components be installed only downstream of other, metallurgically inferior (less noble), components that are possibly present in these kinds of installations. For example, it is possible to install branches with VSH XPress stainless steel pipes from a pipe system consisting of Galvanised steel pipes. In such a case, a non-ferrous metal or synthetic connection piece must be used (see DIN1988).

Another important factor is the ratio between the surface of the noble metal and that of the less noble metal. The higher this ratio, the greater the corrosion rate may be. It is, therefore, recommended that you avoid, as far as possible, using extensions or connection pieces of Galvanised steel and instead stainless steel or brass fittings.

stray currents

Corrosion by stray currents rarely occurs in practice and is immediately recognisable as it starts on the outside of the pipe with a cone-shaped crater to the inside. Stray current corrosion requires a direct current that turns the metal into an anode. The current, which in practice and despite insulation measures penetrates into the earth and from there goes into other neighbouring metal structures, such as a water supply installation, runs through a particular stretch of the system before it returns to earth again. In order to penetrate into the piping system, the earth current must have an entry point at a spot where the normal protective cover of the pipe or connection is damaged or missing.

For this reason, metal pipelines must be earthed (see EU Regulations). Direct current installations are generally not used in domestic households and no real problems occur with alternating current. Research over decades has shown that problems by stray currents only occur sporadically and do not depend on the type of metal.

steel pipes

internal corrosion

Internal corrosion cannot occur with closed-loop water heating systems. The oxygen in the water in closed-loop systems creates a layer of iron oxide on the inside of the pipe thereby preventing any further corrosion. When the heating system is not in use, it must be kept filled at all times or, alternatively, be completely drained and subsequently dried out, to avoid the presence of water and oxygen in the system at the same time.

The necessary additives should be added to prevent frost damage, calcification or corrosion. We are always happy to answer enquiries about the use of additives. Please observe the applicable legislation, regulations and local rules regarding corrosion.

external corrosion

Steel pipe systems are generally installed in such a way that the outer surfaces do not come into contact with corrosive media. If they do come in contact with corrosive media, appropriate measures should be taken.

prevention of corrosion

Instructions will be found in the following paragraphs on how to prevent corrosion problems in the most usual places. A distinction is made between inner and outer corrosion, and the area of application. We shall also examine the various application possibilities of various materials that can be combined in an installation (combi-installations).

internal corrosion

heating installations

The penetration of oxygen in closed-loop heating installations will be prevented if high-quality accessories and compensators with closed membranes are used. When filling the installation, the small quantity of oxygen contained in the water is directly absorbed into the inner pipe surface, in the process of which a thin layer of iron oxide is formed and after which there is no longer any possibility of corrosion. The loss in wall thickness can be disregarded. The heating-circuit water is practically oxygen-free after this reaction.

steel pipes

Internal corrosion is normally impossible in closed-loop heating installations with VSH PowerPress fittings as oxygen from outside cannot penetrate the installation.

water additives

Oxygen scavengers and corrosion inhibitors can be added to the heating-circuit water as a preventive measure against inadmissible oxygen absorption. Observe the supplier's instructions for use.

(potable) water installations

(galvanised) steel

Galvanised Steel pipes and fittings are not permitted in potable water installations. Contact corrosion will occur with Galvanised steel if it enters into direct contact with stainless steel.

external corrosion

general

There are few situations in which outer corrosion occurs in buildings. It is, however, possible in many cases that installations are exposed for a longer period to undesired penetration of rain, humidity or dampness and this can lead to problems. Responsibility for taking relevant measures rests, however, with the user and the installer. Only suitable corrosion protection can offer permanent certainty against corrosion. One way of doing so is to use 'closed cell' insulation, which must be applied in a guaranteed waterproof condition.

Suitable primers - or metallic paints may offer minimal corrosion protection. It is advisable to always use corrosion protection on the piping in situations where corrosion is likely to occur (damp room, crawl spaces, etc.).

effect of insulation

steel

Special attention must be paid to preventing outer corrosion where an environment remains humid for longer periods. Only in cases of sporadic short-term corrosion stress caused by humidity will Galvanised Steel also be resistant against corrosion for a longer period. VSH PowerPress fitting connections must be protected in cases of increased risk of corrosion due to electrolytic outer corrosion (or longer periods of humidity) in a manner satisfactory to the local regulations.

Care should be taken to select hangers of suitable material that is galvanically compatible with the piping system. In addition, piping systems should be properly sized to minimise the risk of erosion corrosion resulting from excessive velocities.

impact of application and processing

heat transfer (e.g. with a heating band)

Heat transfer from outside inwards must be prevented as this can lead to the build-up of film on the inside of the pipe wall. This film can cause an increase in the concentration of chloride ions, which cause pitting in critical concentrations.

underground installations

VSH PowerPress fitting systems and black iron pipe are approved for underground installations. However, any installations must meet all local codes, including those for underground. Proper authorisation must be obtained prior to underground installation from the local authority having jurisdiction.

galvanised steel

With Galvanised steel, waterline corrosion can occur as a result of interaction between three actors (water - metal - gas (air)). This corrosion can be prevented if the piping installation remains permanently filled once filled for the first time. Partial filling will take place, for example, if the pipes are emptied again after a pressure test with water, in which case a pressure test using gas/air is to be recommended.

general

Insulation does not, as a rule, offer any protection against corrosion except in the case of 'closed cell insulation' (sealed watertight), which offers effective protection against corrosion. The installation instructions of the supplier of the insulation material must always be followed carefully. Remove dust, dirt, oil or water from the piping prior to insulating.

The different sections of the insulation material must be carefully joined, taking care that no moisture or water can enter the material.

Also take care that the water barrier of the insulation material is not damaged during installation as moisture could otherwise penetrate under the insulation material.

insulating galvanised steel

No corrosion can occur if there is no humidity between the insulation material and the pipe. If there is a possibility of humidity (condensation) occurring under the insulation, the outside of the pipe will corrode.

13	Limiting screw	DZR brass
14	Limiting pin	DZR brass
15	Limiting seal	EPDM
16	Valve	DZR brass
17	Seat seal	PTFE
18	Lower valve	DZR brass
19	Spindle retaining nut	DZR brass
20	Spindle seats	EPDM
21	Screw	DZR brass
22	Lower handle	Nylon 66
23	Upper handle	Nylon 66
24	Digit register wheel	Nylon
25	Digit register disc	Nylon
26	PowerPress union end adaptor	Carbon steel zinc nickel plated
27	Flat face washer	EPDM
28	Split ring	Stainless steel
29	PowerPress union end	Carbon steel zinc nickel plated
30	Union nut	Carbon steel zinc nickel plated

PP900 Static Balancing Valve PN16

Nr.	Component	Material
1	900 VALVE	DZR brass
2	'O' ring	EPDM
3	Powerpress valve adaptor	Carbon steel zinc nickel plated
4	PowerPress 'O' ring	EPDM
5	Spacer ring	Stainless steel
6	Grab ring	Stainless steel
7	Visu-Control® ring	Polypropylene
8	Protection cap	Polypropylene

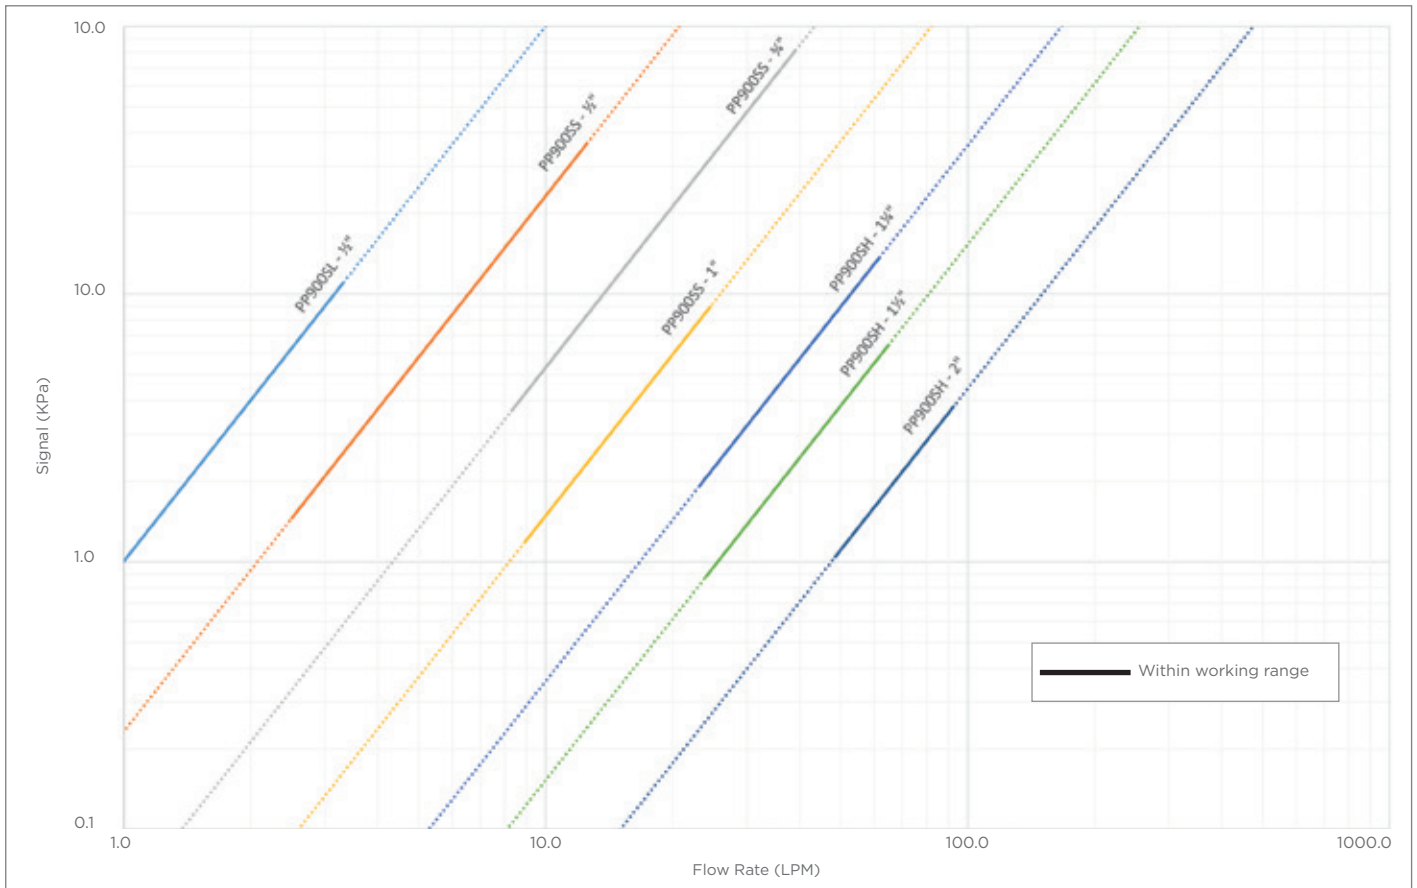

further details

PPSU900 Static Balancing Valve PN16

further details

Nr.	Component	Material
1	900 valve	DZR brass
2	"O" ring seal	EPDM
3	PowerPress valve adaptor	Carbon steel zinc nickel plated
4	PowerPress "O" ring	EPDM
5	Spacer ring	Stainless steel
6	Grab ring	Stainless steel
7	Visu-Control® ring	Polypropylene
8	Protection cap	Polypropylene
9	Union end adaptor	Carbon steel zinc nickel plated
10	Flat face washer	EPDM
11	Union nut	Carbon steel zinc nickel plated
12	Split ring	Stainless steel
13	PowerPress union end	Carbon steel zinc nickel plated

PP902 Dynamic Balancing Valve PN16

Nr.	Component	Material
1	902 valve	DZR brass
2	'O' ring seal	EPDM
3	PowerPress Broen valve adaptor	Carbon steel zinc nickel plated
4	PowerPress 'O' ring	EPDM
5	Spacer ring	Stainless steel
6	Grab ring	Stainless steel
7	Visu-Control® ring	Polypropylene
8	Protection cap	Polypropylene

further details

PPSU902 Dynamic Balancing Valve PN16

further details

Nr.	Component	Material
1	902 valve	DZR brass
2	"O" ring seal	EPDM
3	PowerPress adaptor	Carbon steel zinc nickel plated
4	PowerPress "O" ring	EPDM
5	Spacer ring	Stainless steel
6	Grab ring	Stainless steel
7	Visu-Control® ring	Polypropylene
8	Protection cap	Polypropylene
9	Union end adaptor	Carbon steel zinc nickel plated
10	Flat face washer	EPDM
11	Union nut	Carbon steel zinc nickel plated
12	Split ring	Stainless steel
13	PowerPress union end	Carbon steel zinc nickel plated

PPSU1070 / 125 Gate Valve PN16

Nr.	Component	Material
1	1070/125 valve	Bronze
2	PowerPress adaptor	Carbon steel zinc nickel plated
3	PowerPress "O" ring	EPDM
4	Spacer ring	Stainless steel
5	Grab ring	Stainless steel
6	Visu-Control® ring	Stainless steel
7	Protection cap	Polypropylene
8	Union end adaptor	Carbon steel zinc nickel plated
9	Flat face washer	EPDM
10	Union nut	Carbon steel zinc nickel plated
11	Split ring	Stainless steel
12	PowerPress union end	Carbon steel zinc nickel plated

further details

PP1060A Swing Check Valve PN16

further details

Nr.	Component	Material
1	1060A Valve	Bronze
2	PowerPress valve adaptor	Carbon steel zinc nickel plated
3	PowerPress 'O' ring	EPDM
4	Spacer ring	Stainless steel
5	Grab ring	Stainless steel
6	Visu-Control® ring	Polypropylene
7	Protection cap	Polypropylene

PP4 Pressure Reducing Valve PN16

further details

Nr.	Component	Material
1	PRV PT Valve	DZR brass
2	PowerPress valve adaptor	Carbon steel zinc nickel plated
3	PowerPress 'O' ring	EPDM
4	spacer ring	Stainless steel
5	Grab ring	Stainless steel
6	Visu-Control® ring	Polypropylene
7	Protection cap	Polypropylene

Disclaimer:

The technical data are non-binding and do not reflect the warranted characteristics of the products. They are subject to change. Please consult our General Terms and Conditions. Additional information is available upon request. It is the designer's responsibility to select products suitable for the intended purpose and to ensure that pressure ratings and performance data are not exceeded. The installation instructions should always be read and followed. The system must always be depressurized and drained before any components, whether defective or otherwise, are removed, modified or corrected.

Our fully integrated piping system incorporates a unique offering bringing together valves, fittings and pipes into one complete pipe-work system.

It combines the best world-class elements of modern connection and valve technology, incorporating press, push, groove, compression, capillary and threaded solutions for copper, steel, multi-layer and plastic pipes, with an emphasis on delivering heat free jointing.
